## Embedded – Module

Our  
**embedded module series**  
 brings network know-how  
 to your device!

Our embedded network modules are small modules that can be easily integrated into any end device. They can be installed as SMD or THT components and can therefore be used directly or as an option in any circuit. With only a few additional components, such as an RJ45 socket with integrated transformer and a 3.3 Volt power supply, your terminal device becomes immediately network-compatible and accessible worldwide.

Our focus is on maximum performance in a compact format and there are versions available for a wide range of requirements.
